Project Name	Metro Ticket Generating System in ServiceNow
Maximum Marks	2 Marks

Proposed Solution

S.No.	Parameter	Description
1	Problem Statement (Problem to be solved)	Metro passengers may face long queues, manual ticket booking, fare calculation errors, and inconvenience in managing physical tickets. The existing process can be time-consuming, especially during peak hours.
2	Idea / Solution Description	A ServiceNow-based Metro Ticket Generating System that allows passengers to enter source and destination, select passenger type and ticket quantity, calculate fares automatically, process the booking, and receive a digital QR-based ticket through the Service Portal.
3	Novelty / Uniqueness	The system combines automated fare calculation, ticket processing, and QR-based digital ticket generation within a ServiceNow platform. It provides a centralized and automated workflow instead of relying entirely on manual ticket processing.
4	Social Impact / Customer Satisfaction	The system can reduce waiting time and manual effort for passengers while providing a convenient digital ticketing experience. Automated fare calculation and QR-based verification can also reduce common booking and verification errors.
5	Business Model (Revenue Model)	The system is designed primarily as a demonstration/prototype and does not directly generate revenue. In a real-world implementation, revenue could be generated through metro ticket fares, with the system serving as the digital ticketing and transaction platform.
6	Scalability of the Solution	The solution can be extended to multiple metro routes, stations, passenger categories, and ticket types. Additional features such as smart-card recharge, travel history, payment gateway integration, notifications, and administrative dashboards can be added as the system grows.
